

New syllabus 2022-23

Chapter 4
**Database query
using sql-group by,
having**

MySQL Order By

MySQL Order By clause is used to sort the table data in either Ascending order or Descending order. By default, data is not inserted into Tables in any order unless we have an index.

So, If we want to retrieve the data in any particular order, we have to sort it by using MySQL Order By statement.

Syntax:-SELECT Column_Names

FROM Table_Name

ORDER BY {Column1}[ASC | DESC] {Column2}[ASC | DESC]

MySQL Order By

MySQL Order by– e.g.

Suppose we are having student table with following data.

```
mysql> select * from student;
```

rollno	name	class	marks
1	freya	10	88
2	mohak	1	99
3	vishal	10	84
4	vimal	10	82
5	anil	2	82

Now we write the query – select * from student order by class;

```
mysql> select * from student order by class;
```

rollno	name	class	marks
2	mohak	1	99
5	anil	2	82
1	freya	10	88
3	vishal	10	84
4	vimal	10	82

Query result will be in ascending order of class. If we not specify asc/desc in query then ascending clause is applied by default

MySQL Order By

MySQL Order by– e.g.

Suppose we are having student table with following data.

```
mysql> select * from student;
```

rollno	name	class	marks
1	freya	10	88
2	mohak	1	99
3	vishal	10	84
4	vimal	10	82
5	anil	2	82

Now we write the query – select * from student order by class desc;

```
mysql> select * from student order by class desc;
```

rollno	name	class	marks
1	freya	10	88
3	vishal	10	84
4	vimal	10	82
5	anil	2	82
2	mohak	1	99

Query result will be in descending order of class

MySQL Order By

MySQL Order by – e.g.

Suppose we are having student table with following data.

```
mysql> select * from student;
```

rollno	name	class	marks
1	freya	10	88
2	mohak	1	99
3	vishal	10	84
4	vimal	10	82
5	anil	2	82

Now we write query–select * from student order by class asc, marks asc;

```
mysql> select * from student order by class asc,marks asc;
```

rollno	name	class	marks
2	mohak	1	99
5	anil	2	82
4	vimal	10	82
3	vishal	10	84
1	freya	10	88

Query result will be ascending order of class and if same class exists then ordering will done on marks column(ascending order)

MySQL Order By

MySQL Order by– e.g.

Suppose we are having student table with following data.

```
mysql> select * from student;
```

rollno	name	class	marks
1	freya	10	88
2	mohak	1	99
3	vishal	10	84
4	vimal	10	82
5	anil	2	82

Now we write query–select * from student order by class asc, marks desc;

```
mysql> select * from student order by class asc,marks desc;
```

rollno	name	class	marks
2	mohak	1	99
5	anil	2	82
1	freya	10	88
3	vishal	10	84
4	vimal	10	82

Query result will be ascending order of class and if same class exists then ordering will done on marks column(descending order)

MySQL Group By

The **GROUP BY** clause groups a set of rows/records into a set of summary rows/records by values of columns or expressions. It returns one row for each group.

We often use the GROUP BY clause with aggregate functions such as SUM, AVG, MAX, MIN, and COUNT. The aggregate function that appears in the SELECT clause provides information about each group.

The GROUP BY clause is an optional clause of the SELECT statement.

Syntax –

```
SELECT c1, c2,..., cn, aggregate_function(c1)
FROM table WHERE where_conditions GROUP BY c1 , c2,...,cn;
Here c1,c2,c1,cn are column name
```

MySQL Group By

MySQL group by – e.g.

Suppose we are having student table with following data.

```
mysql> select * from student;
```

rollno	name	class	marks
1	freya	10	88
2	mohak	1	99
3	vishal	10	84
4	vimal	10	82
5	anil	2	82

Now we write query–select class from student group by class;

```
mysql> select class from student group by class;
```

class
1
2
10

Query result will be unique occurrences of class values, just similar to use distinct clause like (select distinct class from student).

MySQL Group By

MySQL GROUP BY with aggregate functions

The aggregate functions allow us to perform the calculation of a set of rows and return a single value. The GROUP BY clause is often used with an aggregate function to perform calculation and return a single value for each subgroup.

For example, if we want to know the number of student in each class, you can use the COUNT function with the GROUP BY clause as follows: Suppose we are having student table with following

```
mysql> select * from student;
```

rollno	name	class	marks
1	freya	10	88
2	mohak	1	99
3	vishal	10	84
4	vimal	10	82
5	anil	2	82

Now we write query—`select class,count(*) from student group by class;`

```
mysql> select class,count(*) from student group by class;
```

class	count(*)
1	1
2	1
10	3

Query result will be unique occurrences of class values along with counting of students(records) of each class(sub group).

MySQL Group By

MySQL GROUP BY with aggregate functions
we are having student table with following data.

```
mysql> select * from student;
```

rollno	name	class	marks
1	freya	10	88
2	mohak	1	99
3	vishal	10	84
4	vimal	10	82
5	anil	2	82

Now we write query—select class,avg(marks) from student group by class;

```
mysql> select class,avg(marks) from student group by class;
```

class	avg(marks)
1	99.0000
2	82.0000
10	84.6667

Query result will be unique occurrences of class values along with average marks of each class(sub group).

MySQL Group By

MySQL GROUP BY with aggregate functions (with where and order by clause)
we are having student table with following data.

```
mysql> select * from student;
```

rollno	name	class	marks
1	freya	10	88
2	mohak	1	99
3	vishal	10	84
4	vimal	10	82
5	anil	2	82

Now we write query—select class,avg(marks) from student where class<10
group by class order by marks desc;

```
mysql> select class,avg(marks) from student where class<10 group by class order  
by marks desc;
```

class	avg(marks)
1	99.0000
2	82.0000

Query result will be unique occurrences of class values where class<10 along

MySQL Group by with Having

The HAVING clause is used in the SELECT statement to specify filter conditions for a group of rows or aggregates. The HAVING clause is often used with the GROUP BY clause to filter groups based on a specified condition. To filter the groups returned by GROUP BY clause, we use a HAVING clause.

WHERE is applied before GROUP BY, HAVING is applied after (and can filter on aggregates).

MySQL Group by with Having

MySQL GROUP BY with aggregate functions
we are having student table with following data.

```
mysql> select * from student;
```

rollno	name	class	marks
1	freya	10	88
2	mohak	1	99
3	vishal	10	84
4	vimal	10	82
5	anil	2	82

Now we write query—select class,avg(marks) from student group by class having avg(marks)<90;

```
mysql> select class,avg(marks) from student group by class having avg(marks)<90;
```

class	avg(marks)
2	82.0000
10	84.6667

Query result will be unique occurrences of class values along with average marks of each class(sub group) and each class having average

MySQL Group by with Having

MySQL GROUP BY with aggregate functions
we are having student table with following data.

```
mysql> select * from student;
```

rollno	name	class	marks
1	freya	10	88
2	mohak	1	99
3	vishal	10	84
4	vimal	10	82
5	anil	2	82

Now we write query—select class,avg(marks) from student group by class having count(*)<3;

```
mysql> select class,avg(marks) from student group by class having count(*)<3;
```

class	avg(marks)
1	99.0000
2	82.0000

Query result will be unique occurrences of class values along with average marks of each class(sub group) and each class having less than
